

EXTERIOR APPLICATIONS AND CLEANING

Building exterior applications are developing day by day, especially with the developments in the construction sector and the sale of different construction materials. Scissor platforms are preferred in order to carry the products to heights and to work safely at that location.

Since exterior applications and cleaning have risky branches, safety measures should be taken and the risk of work accidents should be minimized regardless of the tools and equipment to be used. Scissor lifts are among the least risky vehicles to work at height.

The need for scissor lifts is gradually increasing due to the applications of glass, composite products, alucobont materials and similar construction materials used in the exterior coating applications of buildings, as well as the pollution of such previously applied materials in the atmosphere with the effects of dirt, exhaust smoke and rain water. It is important to choose the right scissor lift platform in order to do the work safely, comfortably and quickly according to the usage area, the nature of the work and the heights needed.
