

## STOCK AND STORAGE AREAS

Scissor lifts are work machines used to easily reach places with high accessibility. As they are used in many different sectors, they are especially used for the transfer of products in the high parts of warehouses in stock areas, collection and distribution centers and factories. Scissor lifts, which have an area of at least 3.8 m<sup>2</sup> with an extra opening of 1 meter in the platform area, enable fast and safe loading, unloading and transportation works at heights with their 350 kg carrying capacity.
