

FACTORY / PRODUCTION FACILITY EQUIPMENT MAINTENANCE AND REPAIR WORKS

In workshops, factories and production facilities, maintenance and repair teams are always ready to prevent work from being interrupted or stopped. Especially factories and production facilities undergo planned maintenance at certain periods. This means that scissor lifts are used in applications such as physical deficiencies and additional works of factories, as well as heavy maintenance and renewal of production machinery and systems. They are used safely with their wide platform dimensions and load capacities, especially in welding, cutting, assembly and installation works at heights, roof, lighting, ceiling cranes and similar maintenance and repair works.
