

USE IN SHIPYARDS

Another usage area of scissor lifts is shipyards. They are used both in the manufacture of new boats, ships and similar marine vehicles, as well as in the renewal of marine vehicles towed to the shipyard for revision, maintenance and repair. Since the biggest problem of the maritime industry is corrosion due to salt water, the sandblasting process is important. Scissor lifts are used for sandblasting, welding, painting, disassembly and assembly operations. They are especially preferred for safe working at overhead and vertical heights.
